Gorgias

Re: Software Engineer — AI Platform

Dear Gorgias engineering team,

I'll be honest upfront: I'm a final-year engineering student (ESPRIM, Cybersecurity & Cloud Computing, graduating June 2027), not a 4-year veteran. But the job description reads like a checklist of what I've been building for the last two years, and I'd rather apply and let you decide than stay silent.

Here's what I bring. I've built **microservices with event-driven architecture** (Kafka, Spring Boot, one database per service) on a private OpenStack cloud, with **full observability** (Grafana, Prometheus, Loki, Wazuh). I've shipped **Node.js/Express backends with React frontends**, containerized with Docker, deployed via CI/CD to cloud platforms. I've designed REST APIs with JWT/OAuth2 auth, built real-time data pipelines (Arduino sensor streaming to a React Native app), and I test with xUnit (36 tests, SQLite in-memory). I know what it takes to take a system from design to deployment.

What excites me about Gorgias is the intersection of **AI and commerce**. On a team project, I worked alongside an AI engineer who built MiraBot, an in-house chatbot for a travel platform — and that experience showed me how powerful AI-driven interactions can be. I'm deeply interested in how AI can transform customer conversations, and the idea of building the infrastructure that powers conversational commerce — real-time messaging, event fanout, AI-driven responses — is exactly the kind of engineering challenge I want to work on.

I'm not going to pretend I have 4 years of experience. But I have the **technical foundation**, the **drive to learn fast**, and the habit of owning projects from scoping to production. I'd be glad to show you what I can do in an interview.

Sincerely,

Mohamed Ben Naima
