Re: PFE Internship — Software Engineering (2026)

Dear Linedata recruiting team,

Final-year engineering student at ESPRIM (Cybersecurity & Cloud Computing, top of class, graduating June 2027), I'm applying for a PFE internship at Linedata. I want to be direct: I'm looking for a place where I can ship real fintech software, learn from experienced engineers, and grow into a full-time role after graduation. Linedata's reputation in financial software — 1350+ employees, 14 countries, products used by banks and asset managers worldwide — is exactly the environment where I want to start my career.

What I bring is not academic theory. I've built a **microservices banking platform alongside my team** (Spring Boot, Kafka, Keycloak, OpenStack) that scored **18/20** and was nominated at ESPRIT's Projects Ball. I've designed a **multi-tier ATM system** (ASP.NET Core, SQL Server, JWT, Docker, 36 xUnit tests) with ACID transactions, PIN hashing, and fraud dispute workflows. And I've shipped a **production ERP** as a Spring Boot Modulith during my engineering internship — purchase, stock, production, sales — deployed on a real Windows Server with RBAC across four business cycles, currently being rolled out to warehouse, production, and finance teams. The banking projects taught me the domain. The ERP taught me what it takes to ship software that real people depend on.

My stack maps directly to what Linedata needs. Backend: ASP.NET Core, Spring Boot, Node.js, Python. Frontend: Angular, React. Databases: SQL Server, PostgreSQL, MySQL. DevOps: Docker, Kubernetes, CI/CD (GitHub Actions, GitLab). Security: JWT, OAuth2, RBAC, Keycloak. I design with SOLID principles, I test with xUnit, and I deploy with containers — not because a course told me to, but because that's how production software works.

What draws me specifically to Linedata is the intersection of finance and engineering. I've spent the last semester building banking systems — accounts, cards, withdrawals, transfers, fraud disputes — and I want to deepen that domain knowledge at a company where financial software is the core business, not a side project. I'm also attracted by the international dimension: working across 14 countries means engineering decisions that scale beyond a single market.

I'd be glad to walk you through my projects in an interview and explain what I can contribute from the first week. Thank you for your time.

Sincerely,

Mohamed Ben Naima
