SDE Internship Recruiting — Dublin

Re: 2027 Software Dev Engineer Intern (Job ID 10418355)

Dear Amazon recruiting team,

Final-year engineering student at ESPRIM (Cybersecurity & Cloud Computing, top of class, graduating June 2027), I'm applying to the 2027 Software Dev Engineer Internship in Dublin. I want to be upfront about what I'm looking for: I'd like to do my **end-of-studies internship at Amazon as a software engineer, and continue with you full-time after I graduate in June 2027**. The six-month option matches my academic schedule exactly.

Two years of building distributed systems at my scale — a microservices banking app (Spring Boot, Kafka, one database per service, OpenStack cloud, full observability) — and I want to see how that work scales to systems used by real customers at Amazon's size. What draws me specifically is the ownership culture: you give an engineer a real project and a mentor, and you expect them to own it. That's how I like to work.

I'll keep this short because my CV is long. Java and Python are my daily drivers, and I ship with Docker and CI/CD rather than handing code over the fence. I've designed distributed systems with real constraints, led a small team, and run projects from scoping to production. On the fundamentals — data structures, algorithms, object-oriented design — I'm ready for your interview loop. When I'm not shipping, I'm on TryHackMe and CTFs: building and breaking systems is the same hobby.

The longer-term pitch is simple. I'm not looking for a summer credential — I'm looking for a place to start my career, and I want to start it by shipping at Amazon. I'd be glad to walk you through my projects in an interview. Thank you for your time.

Sincerely,

Mohamed Ben Naima
